Integrated Postal Architecture
Central Consolidation

Precision Postal Software Design

The Central Consolidation module of the Integrated Postal Architecture (IPA) enables transactions captured at the counters and within branches to be consolidated on Regional and/or Central systems in order to provide a broader view of the business (of the Region or the Enterprise) for the management of the Post.

Using the IPA Central Consolidation system, a Post can produce similar reports to those produced within the branches, but on a Regional or Enterprise view.

The central or regional database can also be accessed by the full Management Information System module of the IPA. The basic Central Consolidation module is designed to provide a cost-effective method of providing key Regional or Enterprise-Wide information to the management.

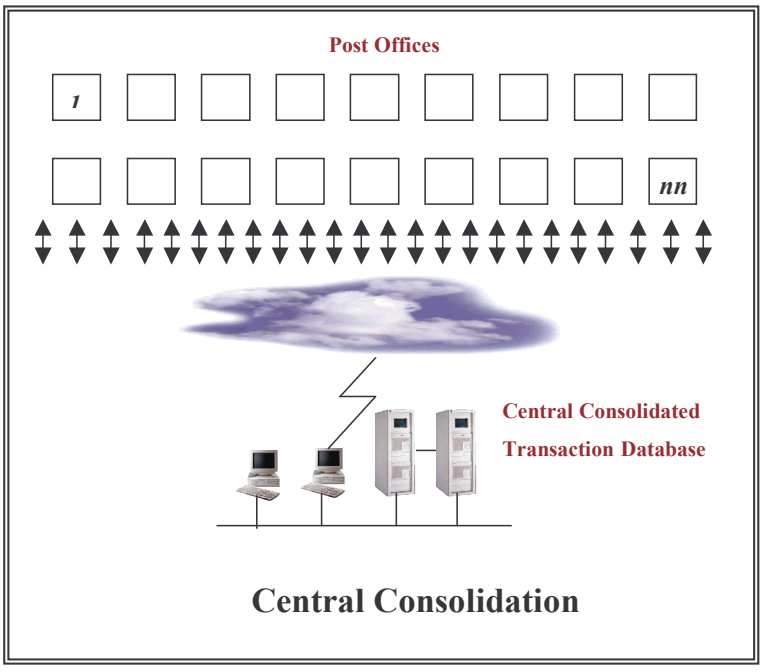

Post Office Configuration

The Integrated Postal Architecture provides a multi-tiered capability for the management of transactions.

At the lowest level, customers are served at the counter and the clerk captures relevant information on the counter workstation relating to the customer transactions. Within the branch this transaction information is captured on all workstations. The transaction manager within *CORVUS* allows for a broad range of summarisation and balancing reports to be produced for the clerk, including stock and cash management reports, transaction summaries, the clerk cash account and clerk balancing.

The defined supervisor is allowed by *CORVUS* to gain a complete office view of the transactions and as such is able to produce office reports based on the consolidated transactions within the database. These reports will include the office cash account, office stock and cash management reports and other consolidated transaction reports.

In the same way that the Supervisor within a post office can gain a consolidated view of all of the counter transactions within an office, the Central Consolidation system enables a Post to gain a Regional or Enterprise-Wide view of the transactions from all post offices and report accordingly.

Central Consolidation

The Central Consolidation module of the IPA is a low cost module that enables a Postal Enterprise to gain a broad view of the business across all of the automated post offices on the network.

IPA Data Entry

It is most likely that there will be some post offices that are not automated. This may be a temporary situation pending full roll-out or simply that automation cannot be justified in many smaller offices.

The IPA Data Entry module enables manual cash accounts or other transaction detail to be keyed directly into the central consolidated database. This process helps to provide a fuller picture of the business for the management.

IPA = Cost-effective, Flexible, Integrated Solutions for the Postal Industry
