Integrated Postal Architecture
Osmium Pensions Management

Precision Postal Software Design

Osmium

Osmium is an automated pensions management system that manages the payment of pensions throughout the postal network bringing in payment controls by use of modern technology.

Osmium can be integrated with the Corvus branch/ counter automation system or operated as an independent free-standing solution.

The Osmium module can be adapted to manage payments from any single source to multiple recipients.

Overview

The major functions of the Pensions Management system fall into the following categories:

⇒ The acceptance of electronic data from the ministry relating to the pensions to be paid

⇒ The distribution of this data to the correct payment Post Office

⇒ The collection of data relating to actual pension payments made

⇒ The return of payment data to the ministry

⇒ Reporting of pension payments made, or not made, within the postal network.

The Post acts as an agent to pay pensions and each week/month receives electronic information regarding the pensions to be paid and normally a single payment covering the total amount to be paid.

Upon receipt of the information from the ministry, *Osmium* sorts the payments by payment office and distributes the relevant payment information to each post office.

When a pensioner comes to the counter to accept their pension, their details are checked. The pensioner hands over their pension voucher and receives the money owed.

A pensioner may receive backdated pensions for an agreed period. After this period, the pensioner must apply to the ministry for payment and it will appear on a future list when it has been approved for payment.

After the payment period is complete, the Post will return the following to the ministry:

⇒ A list of all pensions paid for the period

⇒ A list of all pensions that were expected to be paid, but were not.

Osmium provides for a range of management reports including:

⇒ Payments made, selectable by month and payment office.

⇒ Payments planned, but not made, selectable by month and payment office.

⇒ Payments made in an office that is not the "normal" office for the payment

Osmium makes use of a bar-coded pension book in order to speed up the serving process and enable the correct payment information to be retrieved from the system as quickly as possible.

Facilities are available within Osmium to extend to non-automated offices by the use of reports or by interfacing to the Integrated Postal Architecture single office PC platform IPAOne.
