Integrated Postal Architecture
IPASolo

Precision Postal Software Design

The IPASolo system enables a Post to commence the implementation of an Integrated Postal Architecture at a very low-cost entry point.

Simply by installing a single PC and printer in the back office of a post office, a wide range of business benefits can be attained.

IPASolo includes subsets of a number of IPA modules including Corvus Branch Automation, Indigo3 Money Order Management and Central Inventory Management.

The PC can also be used for other non-PSL functions at other times.

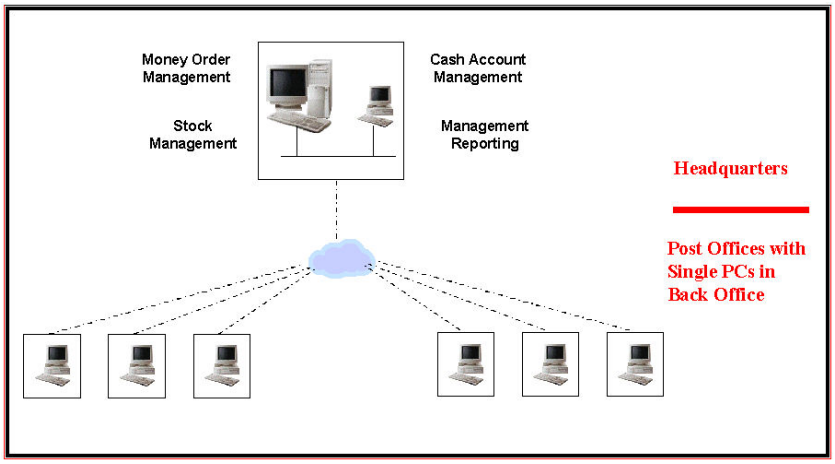

Money Order Management

Money orders continue to be issued manually at the counter. Following issue of the money order, the details of the money orders is captured on the IPASolo system in the back office. Periodically, the details of all money orders issued is sent electronically to a central Indigo3 money order management system at HQ.

The central Indigo3 money order management system periodically sends to the post office details of money orders, issued at other post offices, but due for payment at this office.

This list can be printed and used at the counter to assist in the redeemer identification and the complete redemption process.

This implementation of Indigo3 provides similar benefits in terms of management reporting and fraud management as a full Indigo3 system linked to the counter.

Cash Account Capture

The cash account will continue to be produced manually in the post offices and will be keyed in using data entry screens to the back office PC. This cash account information will be sent electronically to HQ and consolidated with other cash accounts from other post offices in order to produce an Enterprise-wide cash account.

Clearly the more post offices that capture the cash account electronically in this way, the more accurate and complete will be the Enterprise-wide view of the business of the Post.

With the IPASolo system installed in regional, district or other major post offices, sub-post offices can send the manual cash accounts to the local IPASolo office for capture. In this way it is possible for very low cost to build a central view of the business of the complete Postal Enterprise.

Inventory Management

The IPAONE back office workstation can also be used to send stock orders electronically through to headquarters and to maintain office stock levels to promote re-ordering and management of the office value-stock.

Communications

The communication between the post offices can be managed in a number of methods depending upon the infrastructure available and the service to be offered by the Post. This can be by a periodic dial-up connection, leased lines, VSAT etc.
